URD Specifications and Installation Guide Acknowledgement (Job Spec/Signoff Forms)
The requirements and specifications outlined in this guide book must be strictly followed. Any requirements not adhered to can pose safety problems, can be detrimental to the installed system and must be corrected before final acceptance. The Customer will bear full cost to make corrections to sub-standard installations.

The Customer is responsible to provide enough lead time for the Company to design job, provide inspections and install Company equipment where applicable.

Typical lead times are shown below.

<table>

Customer’s Copy
1.0 Scope
The purpose of this specification is to define, interpret and clarify the scope of work and material dealing with providing service to URD’s and is a Supplement to Electrical System Bulletin (ESB) 750.

It is important that the Specifications for Electrical Installations book (ESB 750) be obtained and referred to in conjunction with this supplement for these installations. Any reference to the Company in this specification shall mean the Liberty Utilities. Any reference to the Customer or Developer in this specification shall mean the property owner or the designee of the property owner of the URD.

2.0 General Requirements
All electrical wiring to be connected to the Company equipment shall be installed in accordance with one or all of the following:

- Local Municipal Inspection Authority
- State’s Electrical Code
- National Electrical Code
- National Electrical Safety Code
- Applicable Distribution Construction Standards of the Company
- Liberty Utilities’ Specifications for Electrical Installations

There shall be no attempt to deviate from either the Distribution Standards of the Company or the Company construction plan without the approval of the Company. Any specifications noted shall supersede the Specifications for Electrical Installations booklet unless otherwise approved by the Company.

It is mandatory that the Customer and all parties involved attend a documented pre-construction meeting with a Company representative to discuss the project and ensure it a timely completion. A Company representative will make the necessary arrangements for the pre-construction meeting. Company representatives will also be available throughout the job life cycle to discuss construction problems when requested or during a field visit.

References:
- ESB 750 - Specifications for Electrical Installations
- ESB 759B – UCD Installation and Responsibility Guide
- ESB 759C – Residential Underground Services

All ESB’s are available at http://www.libertyutilities.com/electricalspecifications

The Customer shall be responsible to have all electrical and physical design documents prepared and updated by a design professional, in accordance with Section 1.7 of ESB 750 for the trenching, conduit, transformer pad, and handhole installations.
3.0 Type of Service
Electric service shall be single phase, three wire, 120/240V supplied from a padmount transformer or handhole to be located on the Customer’s premises. On January 1, 2019 the Company will install, own and maintain residential underground secondary services. The Customer is responsible for the installation of the conduit to the house from the designated transformer or handhole. The primary electrical service to the URD will be supplied from a pole or cable system owned by the Company.

4.0 Plans and Other Documents
The total number of house lots proposed to be constructed will be provided in advance to the Company by the Customer, along with a complete copy of the subdivision plans approved by the planning board in the municipality, if such is required by the municipality. The Company will not begin design work prior to receipt of the approved plans.

The Company may require the Customer to provide, in advance and at no cost to the Company, the following:

i. A copy of the approval of the planning board for the subdivision;
ii. Copy of all permits and approvals that have been obtained for constructing the development;
iii. Easements, drafted by the Company, for all facilities required to serve the development;
iv. The name and address of the financial institution providing financing for the development, including a contact person and phone number;
v. A copy of a street light proposal for the development, approved by the municipality, or written notice from the municipality that street lighting will not be required; if installation is requested after construction is complete, additional costs, may be borne by the municipality and/or Customer if the tariff does not collect all costs of construction;
vi. A schedule of Customer’s best estimate for the construction of homes in the development; and
vii. Such other reasonable information that may be requested to confirm the viability of the development.

Conduit Systems in general: will be designed to support a looped primary system with no spare conduit. The Company requires a spare conduit for all Company owned radial duct systems, as shown in Company plans. Other utilities must maintain clearances as outlined in the NESC.

5.0 Permits
In general, all applicable permits necessary to trench and excavate, including street openings and environmental permits, shall be obtained by the Customer and made available upon request of Company prior to design. The Customer shall be responsible for including these padmount and conduit/trench specifications with the wetlands application for developments located in or near wetlands. A copy of the wetlands permit may be requested by the Company prior to acceptance of the conduit/trench system by the Company.

The Customer/Company doing the excavation shall obtain the required DIGSAFE permits before any excavation may take place in a public way. The Customer/Company doing the excavation is urged to obtain copies of the applicable statute and become familiar with its requirements. Similarly, the Customer/Company shall determine if the municipality in which the excavation is to be done requires that water, sewer or other utility, municipal or private, be contacted separately due to the possibility they may not be members of DigSafe®. The
Customer is also responsible to notify the company of all as built changes that may conflict with design).

The Customer shall certify to the Company that areas in which the Company is to perform installation or maintenance work is free of pre-existing contamination by hazardous wastes or materials and to indemnify the Company for any claims, costs, expenses, suits, demands, citations, fines or damages of any kind arising from the presence of any such contamination.

The Company may, at its discretion, construct the underground distribution line in segments, rather than all at once in the proposed development. The Company may, at its option, be exempt from undertaking construction during the period of December 1 to April 1 each year.

6.0 Responsibility and Ownership

The division of ownership and responsibility shall be as outlined below, as specified by the State of New Hampshire PUC Tariff for Retail Delivery Service. Typical installation specifications to reflect installation practices are shown in the back of this guide.

6.0.1 New Underground Residential Development (URD)

The Company shall be responsible for:
- Develop the plan to provide underground electric service for the development,
- Designating riser pole location or underground switching cubicle for primary service
- Supply a list of approved manufacturers and their part numbers for equipment to be supplied by the customer, (See Pages 35 – 37)
- Designate the location of all Company owned equipment,
- Provide Company owned street light foundations and any cable required for street light applications,
- Provide, install, own and maintain all transformers, Company owned street lights, primary and secondary cable, except services,
- Make all connections to Company equipment,
- Inspecting transformer foundation boxpad installation (including ground grid), other designated Company owned equipment installations, conduit system, and trenching to provided Company specifications, installed by Customer and prior to backfilling
- Determine if oil containment shall be required for padmount transformer installation.
- Install, own and maintain all secondary service cables from the Company’s equipment to each Company’s designated meter location,

The Customer, at no cost to Company, shall be responsible for:
- Contacting Liberty Utilities to request for a new electric service for an Underground Residential Development and obtain a work request number. This should be one of the first actions in the process to provide for applicable planning, material order, and construction schedule.
- Provide, prior to the start of the Company’s construction, all applicable documents required for the Company to prepare easements and design for its facilities to be installed on private property,
- Install foundations and conduit, provided by the Company, for Company owned street lights, which locations have been approved by the local municipality,
- Provide and install all required handholes, boxpads, pull/splice boxes, grounding systems, and conduit including spacers, galvanized conduit and sweeps for riser poles including bonding clamps and neutral tap, glue and pulling tape, etc. as indicated on the Company’s plan and related construction specifications,
Supply copies of all invoices, when requested, indicating manufacturer and part number for all such equipment above; equipment that is not approved shall not be used without the prior written consent of the Company,

Turn over ownership of the conduit system, excluding the service conduit, to the Company upon inspection and acceptance of the conduit system by the Company,

Provide and install material for oil containment under padmounted transformers where required.

6.0.2 New Underground Single Phase Primary Radial Service Located on Private Property to an Individual Residential Customer

The Company will provide a Single Phase Primary Radial Service to a Residential Customer from the Company’s distribution system under the conditions shown below.

**The Company shall be responsible for:**

- Developing the plan to provide underground electric service (if feasible);
- Designating the location of all Company owned equipment, the service entrance, and meter location;
- Designating riser pole location or underground switching cubicle for primary service;
- Designating pad mount transformer location with protection (bollards), if required, and if oil containment is required for transformer foundation boxpad;
- Providing the Company owned transformer foundation boxpad and grounding for single phase pad mount transformer, along with pull box (if required).
- Inspecting transformer foundation boxpad installation (including ground grid), other designated Company owned equipment installations, conduit system, and trenching to provided Company specifications;
- Installing, owning and maintaining:
  - Single Phase Pad Mount Transformer, primary cable and cable terminations, secondary cable, and meter (up to and including 400 Amp service).

**The Customer, at no cost to Company, shall be responsible for:**

- Contacting Liberty Utilities to apply for a new electric service and obtain a work request number. This should be one of the first actions in the process to provide for applicable planning, material order, and construction schedule.
- Obtaining any required municipal electrical permits and arranging electrical inspection.
- Providing, prior to the start of the Company’s construction, all applicable documents required for the Company to prepare easements for its facilities to be installed on private property;
- Providing, prior to the start of the Company’s construction, a signed easement, drafted by the Company, for Company owned equipment on private property;
- Installing all required foundations, handholes, pullboxes, grounding systems, and conduit including spacers, glue and pulling rope, etc., according to the Company’s plan and Specifications.
- Installing a primary riser (conduit system), 8 feet above ground shall be galvanized steel, including 90 degree steel sweep flush mount to pole designated by the Company, and bonding clamp with copper wire tap for grounding. The Company will install ground rod and complete bonding requirements;
- Providing and installing Company approved Self-contained Meter Socket at location Pre-Approved By the Liberty Utilities Meter Department. Refer to Liberty Utilities ESB # 750 Specifications for Electrical Installations, latest version, Section 7.0 Metering, for Self-contained Meter Socket requirements.
7.0 Easements
In general, Company-owned equipment shall not be installed on the Customer’s property prior to the execution of suitable easement(s). The Customer will have to provide to the Company (for the purposes of securing an easement) the following items, including but not limited to:

- Copy of property deed showing: owner, date, book number, page number county registry, and survey and/or plan of record, if available.
  Note: When electronic maps are used, the Customer must consult the Company for submittal.
- Copy of mortgages showing: holder, date, book number, page number and county registry.
- Copy of any applicable trusts showing: date, book number, page number and county registry, and who is authorized to sign legal documents on behalf of the Trust.

Easement application forms are located on Page 33. Refer to Sections 3.1.3 and 4.1.1 in ESB 750 for further easement requirements applicable to the Applicant or Customer.

8.0 Trench Construction Requirements

a. Layout and Grading
   i. Final grades shall be established and the binder coat installed, and easement boundaries, street, lot and trench lines staked by the Customer before any trenching is started (except for Company inspected road crossings).

b. Trenching and Backfilling
   i. The Customer shall adhere to the construction plan specifying trench locations and depths, with any deviation being subject to approval by the Company.

   ii. Minimum burial depths specified for all electrical conduit and direct burial trenches shall be maintained during all phases of construction. Temporary mechanical protection over buried conduit during construction to prevent conduit crushing or damage due to unusually heavy construction equipment shall be the responsibility of the Customer.

   iii. Trench detail shown in attached Company Standards shall be adhered to. The trench bottom shall be solid, undisturbed earth. Earth showing signs of peat, cinders, rubble or any conditions not suitable for a stable foundation shall be reported to the Company Representative for recommendation. Pockets of unsuitable soil shall be replaced with compacted sand.

   iv. For work done by Customer, a Company representative shall be notified in advance of the backfilling of any electric facility, i.e., conduit, foundation, handhold, pull-box, cable-in-conduit, grounding, cables, etc.

If any facility is backfilled without the Company’s prior approval, the Company reserves the right to require re-excavation of the facility.
aa. Sand for conduit installation - A minimum of three inches of sand shall be placed, under, beside, around and on top of all electric conduits. The sand shall pass through 3/8 inch mesh screen and shall not contain any sharp stones. Sand shall be placed and suitably tamped over installed conduit in reasonably small quantities (not a front end loader bucketful all at once) to avoid conduit damage. Sand shall be evenly distributed between and around all electric conduits.

v. Remainder of backfill shall not contain stones greater than once inch and shall not contain ashes, cinders, shell, or frozen material,

vi. Trenches shall be immediately backfilled following cable or conduit system inspection and approval by authorized Company representative,

vii. Backfilling shall be accomplished in a continuous manner from one terminal, i.e., riser pole, foundation, handhold, etc. to the next,

viii. Backfilling shall not take place over any open-ended (unplugged) conduits,

ix. Company approved red cable “Warning” or “Marking” tape shall be installed in the trench 12 inches below finished grade and directly above the cable or conduit.

9.0 Trench and Conduit System Inspection

In the applicable area, a designated Company inspector shall be responsible for the inspection of the trench and/or conduit system being prepared and installed by the Customer at various stages of installation. The Customer shall provide the Company inspector with a minimum of 24 to 72 hours’ notice.

Inspections shall be conducted:

1) After conduit, ground system are completed; but before concrete is poured
2) After concrete is poured, but before backfilling if applicable
3) After backfilling

The inspection shall include, but not be limited to the following:

➤ All trenches and excavations
➤ All material supplied by the Customer
➤ All backfill and base sand material during or after installation as applicable
➤ All foundations, pull-boxes, boxpads, handholes, ground grid, and other facilities, after setting in place, but prior to backfilling
➤ All galvanized steel riser pole and sweep conduit installations, all conduit, including cemented joint, bends, sweeps, bell-ends, and conduit spacers, prior to backfilling, or concrete encasement
➤ All conduit terminations and supports at boxpads, pull-boxes, handholes, riser poles, streetlight foundations, and at other applicable locations
The pouring of any required concrete encasement and subsequent backfilling around the conduit runs

All backfilling operations

Witnessing mandrelling of all conduits

10.0 Conduit Installation

a. Conduit shall be installed, by Customer, in accordance with the Company Standards and Construction Plans which accompany this specification package.

b. Plastic spacers shall be used to separate all ducts where more than one duct is installed. Spacers shall not exceed eight foot intervals. Spacers shall be placed at each coupling. Spacers are required to maintain proper separation from adjacent conduits and to aid in proper sand placement for thermal reasons.

c. Type DB conduit shall be employed whether duct is direct buried or encased in concrete.

d. All galvanized steel sweeps at risers shall have a minimum radius of 36 inches. 48 inch radius sweeps are required at transformer foundations and secondary handholes. See Page 13 for details.

e. Curves and bends in conduit runs shall be gradual, and the radius of curvature shall not be less than 40 feet. Only five Degree Angled Couplings shall be used to make these gradual bends.

f. Conduit grade shall be such as to cause all ducts to drain toward one or both equipment foundations, primary pull/splice boxes or handholes. Minimum pitch shall be three inches per 100 feet. Pull/splice boxes may be required near riser pole if grade at pole is low compared to the first boxpad to alleviate water buildup in risers.

g. Conduit shall have a maximum penetration inside walls of primary pull/splice boxes, equipment foundations or handholes of three inches. All unused conduits and conduit knockouts shall be sealed with conduit plugs. Bell ends shall be installed at the end of all conduit runs.

h. The minimum separation between electrical conduit and foreign conduit or pipes shall be as follows:

- Communication systems – 12 inches
- Water, Gas and Sewer – 12 inches where the paths of these utilities intersect electrical conduits at approximately right angles. A minimum separation of 24 inches shall be maintained between parallel placement of any of these utilities and electrical conduits.

i. All road crossings shall, when practical, be perpendicular to the sidelines of the road.

j. All road crossings shall have 30 inch minimum burial depth, top of conduit to finished grade, for primary and 24 inch minimum for secondary voltages. (including street lighting cable-in-conduit) Main electric trench shall maintain conduit depths as shown in on
Page 29. A primary burial depth could be lessen to 24 inch minimum where supplemental protection is provided (i.e. concrete or steel barrier). Approval of Company representative is required.

k. Where foreign objects threaten to interfere with the installation of conduit in the sidewalk area or other areas, the Company may require concrete encasement of the conduit.

11.0 Transformer Box Pad Installation

► All foundations shall be level and installed in accordance with drawing on Pages 12-13.

► A minimum of four inches base course of crushed stone (3/4 in maximum stone size) shall be placed under all transformer foundation excavations and thoroughly compacted using a vibratory compactor. Certain soil conditions may require removal below normal depth and subsequent additional clean sand or stone added and compacted to insure sound base course for foundation. For direct burial cable installation, cables are to be surrounded by at least 4” of sand at base area crossing from the trench into the box pad.

► Transformer foundation top surfaces shall be four inches above final grade. In no instance shall final grades hamper proper access or operation of equipment.

► A buried ground grid shall be installed in accordance with details shown on Pages 16 and 17. Ground loop around transformer to be buried 12” below finish grade (not at foundation base depth). Telephone Company bond wires shall be tied to the ground grid. Such bonding or connection shall not interfere with connecting Company equipment.

► Retaining walls or other devices shall be installed where slopes exist that would undermine or cover equipment, such as transformers due to sharp drop-off or rise.

► Upon completing the installation of the transformer foundation, the top opening shall be securely sealed with a suitable matching cover.

**NOTE:** In most instances, the Company shall require that equipment easements on private property be reasonably level. Also, all retaining walls shall fall outside of equipment easements and in no case shall they hamper door openings or placement of such equipment. Retaining wall design shall be approved by the Company.

► Transformer foundation shall be completely backfilled prior to commencing any cable pulling.

► In some locations oil containment may be required for box pad installation, Pages 22 and 23 show installation procedure.

12.0 Transformer or Handhole Secondary Service

On January 1, 2019 the Company will install, own and maintain residential underground secondary services. The Customer is responsible for the installation of the conduit to the house from the designated transformer or handhole. Refer to Liberty Utilities ESB No. 759C Residential Underground Services for Electric underground residential service installation requirements.
13.0 Transformer Grounding and Bonding
The ground grid shall be #2, bare, soft drawn, 7 strand copper wire. The wire shall be installed 12 inches below finished grade and located around the transformer pad as shown on Page 16. Bond to all exposed metallic conduit and leave three feet of wire above pad for grounding transformer.

Two \( \frac{3}{8} \) inch diameter, eight feet long copper weld ground rods and approved connectors shall be installed to 12” below finished grade. Leave the ground rods and grid exposed until inspected by the Company. The ground grid is to be complete and backfilled prior to energizing the transformer. Connections to ground grid to be made with compression connectors as shown on Pages 14 and 15. However exothermic welding ("cad weld") shall be an acceptable alternative to a compression connection. Bolted connectors are only acceptable for the ground grid connections to the ground rods. The Company shall install the ground taps onto the transformer.

14.0 Spacing of Boxpads, Pull/Splice boxes, and Handholes
All communication boxes shall be a minimum of 2’ away from any Company boxpad, pullbox or handhole. Also, communication equipment shall not be placed in front of any Company equipment.
15.0 Proper Transformer Pad and Conduit Layout

Figure 15.0-1 Preferred Location of Equipment in Easement Area
Figure 15.0-2 Single Phase Padmount Transformer — Typical Layout

15.0-3 Single Phase Padmount Transformer — Direct Burial Layout
16.0 Transformer Ground Grid Bonding

Figure 16.0-1 Single Phase Padmount Transformer Ground Grid

Notes:

1. The ground grid shall be #2, bare soft drawn, 7 strand copper wire. Installed 12 inches below finished grade and located around the foundation used for cabinets. Drill 5/8 inch diameter holes as shown in sides of foundation if not provided by foundation manufacturer.

2. Two 5/8 inch diameter, eight foot long copperweld ground rods and approved connectors shall be installed 12 inches below finished grade.

3. Leave the ground rods and ground grid exposed until inspected and approved by the Company representative.

4. The ground grid is to be complete and backfilled prior to energizing the equipment.
Notes:

1. The ground grid shall be #2, bare soft drawn, 7 strand copper wire. Installed 12 inches below finished grade and located around the foundation used for cabinets. Drill 5/8 inch diameter holes as shown in sides of foundation if not provided by foundation manufacturer.

2. Two 5/8 inch diameter, eight foot long copperweld ground rods and approved connectors shall be installed 12 inches below finished grade.

3. Leave the ground rods and ground grid exposed until inspected and approved by the Company representative.

4. The ground grid is to be complete and backfilled prior to energizing the equipment.
17.0 Proper Transformer Pad and Conduit Installations

17.0-1 Proper Conduit Bank Installation (Pre-Backfill)

17.0-2 Proper Installation of Conduit with Pullbox used for Drainage (Pre-backfill)
17.0-4 Properly Completed Transformer Installation (Final Grade)
17.0-5 Properly Completed Handhole Installations (Final Grade)
18.0 Transformer Oil Containment

Figure 18.0-1 Single Phase Oil Containment for Cables in Conduit

NOTES:

1. Dig out as least an additional foot on bottom and sides for boxpad area and stub conduits out into the pit.

2. Install geotextile liner in pit along the bottom and sides up to 6” from finished grade.

3. Make vertical cuts in liner to accommodate conduits.

4. Overlap the liner flaps around the conduit and seal both liner seam and in between conduits with expanding foam.

5. Fill in area with 6” of compacted silty sand.

6. Install second layer of geotextile liner by repeating steps 2 and 3.

7. Install 4” minimum of gravel base for boxpad to be at proper grade.

8. Set boxpad and make up conduits into it.

9. Install ground grid and backfill after company inspection.
NOTES:

1. Dig out as least an additional foot on bottom and sides for boxpad area and stub conduits out into the pit.

2. Install geotextile liner in pit along the bottom and sides up to 6” from finished grade.

3. Make small holes in the liner, feed liner through holes into pit.

4. Once cable is pulled, seal the liner around the cable with expanding foam.

5. Fill in area with 6” of compacted silty sand.

6. Install second layer of geotextile liner and cut holes for cables as in note 2.

7. Install layer of gravel for cable routing and base for boxpad to be at proper grade.

8. Set boxpad, train cables into boxpad and fill on top of cables with sand.

9. Install ground grid and backfill after company inspection.
**Geo-textile Liner**
Generic name is: 16 oz. polypropylene geotextile. Also called filter fabric weighing 16 oz./square yard.

**Brand names / Suppliers are:**

19.0 Riser Pole
The Company shall designate conduit riser locations on the pole. All primary risers shall be Galvanized Steel, this includes the 90 degree sweep. Per NESC all steel risers must be bonded 6" from top and the bond must be at least 8' high from finished grade.

The Customer is responsible for providing and installing the bond clamps and the tap. The Company will make the bond connection from the riser bond tap to the ground system on the pole. Spare riser sweep shall be bonded also. Approved materials reference is located on Page 35 - 37.
Properly Installed Primary Risers

**Riser Pole Bonding**
Rigid Galvanized Steel. Bond higher than 8’ and at least 6” from top.

**Completed Riser Pole**
The Company will specify on which quarter of the pole the riser shall be installed, away from traffic.

**Spare Riser Sweep**
Spare sweep shall be bonded to down ground and capped at riser pole.
20.0 Primary Cable Pull/Splice Box
This primary conduit equipment may be specified in the design for installation in sidewalks or grass plot areas where duct length or design requires extra pulling locations or splices. The splice box is H20 rated and shall be installed in locations not frequently traveled over by vehicles. Pull/splice boxes are supplied and installed by the Customer.
Properly Installed Primary Pullbox
21.0 Trench Requirements
Final grades shall be established; the surface rough graded within 6” of finished grade, and roadway and property boundaries shall be staked or marked by the Customer before any trenching is started.

The Customer shall adhere to the construction plan and specifications regarding trench locations, trench depth, and concrete encasement. Any deviation shall be subject to approval by the Company.

The Company shall be notified in advance of the backfilling of any electric facility. The Company reserves the right to require re-excavation of the conduits and foundations if the Customer fails to have inspection done or backfills before inspection.

If the trenching for the conduit installation is in an existing URD area that has buried energized conductors it is an OSHA requirement to use approved electrically qualified excavators. The Company will install conduit/pull boxes/foundations when required to excavate in the area of buried energized conductors at a predetermined cost to Customer/Developer/Contractor.

For special circumstances that call for concrete encasement, such as crossing a culvert or stream, trenches shall not be backfilled until concrete has set (for at least two hours) and after approval by authorized Company personnel. All backfill shall be sand or gravel containing stones less than 1” in any dimension. Backfilling shall not take place over any open-ended (unplugged) conduits. Company approved red “Warning” tape shall be installed directly above the Company’s cable eight to 12 inches below finished grade. Laying the warning tape directly on the cable, concrete or conduit is not acceptable. Certain installations in the public way may require flowable fill instead in place of normal backfill.

21.1 Trench Depth Concrete Encased Conduit

Burial depths for electrical conduit shall be maintained not less than 30” from the top of the concrete encasement to grade during all phases of construction. The trench bottom shall be solid, undisturbed earth. Earth showing signs of peat, cinders, rubble, or any conditions not suitable for a stable foundation shall be reported to the Company for recommendation. Small pockets of unsuitable soil shall be replaced with compacted gravel (maximum 2” stone). At riser pole, end concrete encasement just before riser sweep.
22.0 Conduit Requirements
The *Customer* shall be responsible for all trenching, excavation, backfilling, and installation of the primary duct system. The *Customer* is also responsible to install any necessary pullboxes. Concrete encasement shall be provided and installed by the *Customer* as specified by the *Company* when required. Refer to 6.0 Division of Responsibility.

22.1 Pulling Tape
All conduits shall have a pulling tape, also known as “Mule Tape.” This tape is to be rated for 2,500 lbs. of tensile strength. Manufacturers of this tape are listed on Page 34.

22.2 New Hampshire:
The *Customer* shall ascertain the requirements of the specific municipality in which the development is located. For example, some municipalities may require that the *Customer* employ a licensed electrician to direct the installation of all conduit intended for electric facilities. Temporary mechanical protection over buried conduit and encasements is recommended to prevent crushing or damage during construction, and is the *Customer’s* responsibility.
All road crossings shall, when practical, be perpendicular to the sidelines of the road.

The minimum conduit size shall be 4” for three phase and 3” for single phase cable installations. All sweeps at foundations and risers shall have a minimum radius of 36 inches. The riser sweep shall be galvanized steel. The Customer shall install conduit plugs in all unused conduits and pulling tape. At the riser pole, the galvanized rigid steel sweeps and the PVC/steel adaptors shall not be concrete encased. The Customer shall be responsible to install rigid galvanized steel straight conduit up the pole high enough to meet NESC code referenced on the riser pole requirements on Page 25, including conduit ground straps, up the riser pole (unless directed otherwise by the Company). The Company will specify on which quarter of the pole the riser shall be installed, usually away from oncoming traffic.

Except as noted on construction prints, curves and bends in conduit shall be gradual, and the radius of curvature shall not be less than 40 feet. All curves shall be formed with five-degree couplings. The minimum length between single, five-degree couplings is 42”.

Conduit grade shall be such as to cause all ducts to drain toward one or both equipment foundations or pullboxes. Minimum pitch shall be three inches per 100 feet.

The Customer shall insure that clearances are met and maintained, and that they are inspected by the Company. Unless local jurisdictions require greater clearances, the minimum clearances shall be as follows:

**22.3 Communication Systems** – Company conduit shall not be directly above or below communication conduit, except when crossing below communication conduit at approximately right angles. Company conduit and communication conduit shall be separated by a minimum of 3” of concrete encasement.

**22.4 Non-Company Water, Gas and Sewer** – Company conduit shall not be directly above or below any of these foreign utilities, except when crossing above these utilities at approximately right angles. Where the paths of these foreign utilities cross under Company conduits at approximately right angles, the minimum separation is 12”. A minimum separation of 24” shall be maintained between parallel placement of any of these utilities and electrical conduit.

The Customer shall rod and mandrel all primary conduits to insure their integrity before the Company shall attempt to pull any primary cable. The Customer shall furnish and install an approved synthetic, 2,500 pound test tape in each primary conduit run including risers. Pulling tape installation and rodding the duct shall be witnessed by the Company.

Company-owned duct shall not share a concrete encasement with foreign utilities (e.g. do not place communication or private electrical duct in the same concrete encasement as Company duct).

At those locations where manholes or above ground switchgear are required, additional specifications will be provided by the Company.

**23.0 Metering**

Refer to the Company’s Specification for Electrical Installations book for the type of installation. Division of work and material will be performed with the approval and authorization of the Company’s Metering Services department. In most instances, the Company will furnish, install, own, maintain and connect all meters required for billing purposes at the delivery voltage on the customer’s side of the service point.

For the latest authorized version, please refer to the company’s website at [http://www.libertyutilities.com/electricalspecifications](http://www.libertyutilities.com/electricalspecifications).
24.0 Sectionalizing Cabinets – Three Phase and Single Phase Applications

This primary sectionalizing cabinet may be specified in the design for installation in the UCD or URD primary distribution system. The Company will supply and install this equipment. The foundations used for mounting this equipment will be part of the duct system infrastructure which is the responsibility of the Customer/Developer. The three phase sectionalizing cabinet is designed to fit on top of a primary cable pull/splice box and a single phase sectionalizing cabinet is designed to fit on top of a transformer box pad foundation. Both sectionalizing cabinets require the installation of a ground grid (installed by Customer/Developer), see detail below.

Sectionalizing Cabinet Ground Grid Installation:

1. The ground grid shall be #2, bare soft drawn, 7 strand copper wire. Installed 12 inches below finished grade and located around the foundation used for cabinets. Drill 5/8 inch diameter holes as shown in sides of foundation if not provided by foundation manufacturer.
2. Two 5/8 inch diameter, eight foot long copperweld ground rods and approved connectors shall be installed 12 inches below finished grade.
3. Leave the ground rods and ground grid exposed until inspected and approved by the Company representative.
4. The ground grid is to be complete and backfilled prior to energizing the equipment.
# 25.0 Easement Applications Form

LIBERTY UTILITIES EASEMENT APPLICATION FORM

<table>
<thead>
<tr>
<th>FOR LIBERTY UTILITIES’ USE ONLY</th>
</tr>
</thead>
</table>

**Application for Easements (check one):**

- OH (jointly owned or solely owned)
- UG
- Electric
- Padmount transformer only
- URD
- Gas

**Work Request Number**

______________________________________________________________________________

Utility Engineer’s Name: ___________________________ Telephone Number: ____________________

Please complete ALL of the sections below so that we may prepare an easement for your signature.
Do not leave any sections unanswered. If a section does not apply to you simply put “n/a” on that line.
Incorrect or incomplete information will delay service installation.

**Property Owner(s):** ____________________________________________________________

**Re: Subdivision Title:**

1. Provide us with a **RECORDED** copy of the present owner’s deed, Book______ Page______

   a) If multiple deeds make up the whole parcel, please include all deeds.

   b) If the Property Owner is a b1) CORPORATION, b2) TRUST, b3) PARTNERSHIP, or b4) LIMITED LIABILITY COMPANY, provide the following which is applicable:

   - b1) President Name: _____________________ Treasurer Name: _____________________________

   See Footnote1 Below

   Or

   - Vice President: _____________________ Asst. Treasurer: _____________________________

Footnote1: If neither “Name Combinations” is available, the person(s) signing the easement must have a Corporate vote authorizing them to sign on behalf of the Corporation.
b2) Trust: No. Of Trustees: _____________________ Name(s): _____________________________
Name of Trust: ______________________________________________________

b3) Partnership: Number of Partners: ______________ Name(s): _______________________

b4) LLC: Authorization to Sign, Name(s): ________________________________

2. a) Provide us with an approved: “Definitive Subdivision Plan”

Plan Book: ___________________________ Plan: ___________________________ Dated: ________________

b) If there is no recorded subdivision plan please include the following information:

Assessor’s Map: _________________________ Block: ___________________________ and Lot: ___________

3. Is your property mortgaged (circle one)? YES NO

If “YES”, please complete this section:

a) Name of Bank/Company/Person holding mortgage(s): ______________________________

b) Address of mortgage holder(s): _______________________________________________

c) Date and recording information of mortgage(s): _______________________________

Date: __________ County Recorded: __________ Book: __________ Page: __________

Liberty Utilities provides water, electricity, and gas utility services to communities across the United States.

Serving over 750,000 customers in twelve states, Liberty Utilities is unique among its peers for its commitment to the community, conservation, and customer service. Liberty Utilities upholds the highest standards of service to meet the day-to-day needs of its customers and offers employee programs that recognize superior customer support and contribution to the community. Liberty Utilities has operations in Arizona, Arkansas, California, Georgia, Iowa, Illinois, Kansas, Massachusetts, Missouri, New Hampshire, Oklahoma, and Texas.
