

Considering Renewable Energy?

Solar and Renewables is a renewable energy program that was established by the New Hampshire legislature. Customers who install eligible generation sources on their property can use the generation to reduce their electric consumption.

On a monthly basis, this program pays customers for any excess electricity generated over what the customer consumes at their home during the month.

Customers can stretch their generation even further by taking advantage of Liberty's many energy efficiency programs. Using energy more efficiently means homes will require less to run, which may allow customers to send more energy back to the grid, resulting in a payment.

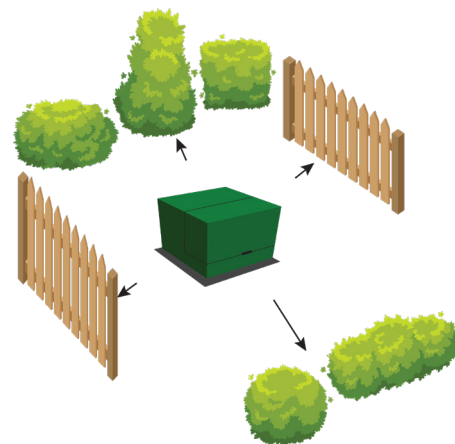

For frequently asked questions, connection requirements, information about efficiency programs, and links to rules and regulations, please visit the "Smart Energy Use" section of our website.

Underground Service Safety

If your property has an underground electric service, you may have a box in your yard mounted on a cement or fiberglass pad. That box is called a transformer.

In the event of an emergency, or other issues with your service line, our crews need immediate access to your transformer. **For this reason, it is imperative customers do not place vegetation, or other material, 10 feet in front of the transformer's doors and four feet around the other three sides.**

Issues involving transformers are often time sensitive. If material is placed, or has grown, into the area where the transformer is located, Liberty has the right to remove and/or cut obstructions without prior notice to the owner, as stated in the initial installation agreement.
